the Screen on my Galaxy S3 is blank. I'm wondering if I can control it with this from my computer? Also, how would I install on to theS3

is your device rooted? or if USB Debugging is enabled?

You can download our free desktop program here to check if your device can be detected:

if your device can be detected, then can install our app, and control it from a PC.

Thanks for reply. S3 is not rooted. It turns on because I can hear the startup sounds and responds to touches with appropriate sounds, but no visible screen to use. I hooked it up to computer, but it says the device is faulty and won't read (probably because I can't see or enable USB debugging on the phone). I can pull the SD card out read and write from my computer, but don't know if that helps. THX - Jeff

Does Windows recognize your device as USB Storage? if USB debugging is not enabled, there isn't much can be done.
