

got it working

Posted by akeutel - 2014/11/08 00:16

i bought this this week and had many problems especially BSOD error 12F @ win7 enterprise.

i found out why this error comes too.

defrag the vhd file and after install of win7 boot normally, get bsod and then boot it in safe mode then it says you can't setup in safe mode, then boot normal.

after all >> "vbootctl dp_add default" in commandline and reboot

then install all updates without optionals, reboot and check again

if really all updated, make copy of vhd (a super duper clean windows xD)

then install drivers (i used iobit driver booster pro 2)

sometimes bsod happen, then do hardware reset and it should boot... always keep vhd-file defragged

this afternoon i setup up my programmer-working-system winserver2003, i keep you informed

next week i will setup win10

hope their will be updates in the near future

regards a.keutel
